

If you would like to date stamp various types of policy, procedural, and pricing documents automatically when they're viewed and possibly printed by your user base, we have a solution for you. Our DocuShare PDF Stamper customization lets you select which documents are to be stamped and how they're to be stamped and stamps on the fly when users click on them. There's an option to apply a stamp only once a day to avoid redundant processing and to speed up retrieval.

You can place the stamp anywhere you want on the page with easy options to select the center or various edge positions. You can select the font, size, color, and opacity for watermark results. Within DocuShare we use a document property that lets you select the text string you want to use in the stamp using a menu selection. The stamp phrases are contained within a small xml file where you include a variable for the current or future date. Setup for this would take about 30 minutes following our installation instructions. PDF Stamper currently works on DocuShare 6.5.3 and 6.6.1 and we will update it as necessary.

Here are some example phrases using 1/5/2012 as the current date:

This document printed January 5, 2012 is valid for 15 days.

Copy expires: 2/5/2012

Draft printed: 01-05-2012

You can also do watermark text with transparency to invalidate the document for general use.
